TITLE:

Quaternary Salts of the N-Monoxides of Derivatives of Phenazine and Quinoxaline (Chetvertichnyye soli N-monookisey proizvodnykh fenazina i khinoksalina)

PERIODICAL:

Zhurnal obshchey khimii, 1959, Vol 29, Nr 1,
pp 226 - 234 (USSR)

ABSTRACT:

Phenazine, quinoxaline and their derivatives form N-monoxides and N,N-dioxides with peracids like the tertiary amines, pyridine and quinoline. In reactions with alkyl halides or dialkyl sulfates they give quaternary salts, which have not been synthetized and investigated before. The article describes the syntheses of the quaternary salts of the N-monoxides of phenazine, quinoxaline and some of their derivatives, as well as the properties of such salts. Heating the monoxides of phenazines or their alpha- and beta substitution products in a nitrobenzene solution containing a slight surplus of neutral dimethyl sulfate gives the corresponding quaternary salts (Diagram 1). Quinoxaline derivatives show a similar reaction. These salts of the N-oxides form at 115-130°C. with a short time. The completion of the reaction can easily

Card 1/2

Quaternary Salts of the N-Monoxides of Derivatives
of Phenazine and Quinoxaline

SOV/79-29-1-48/74

be determined: The oxides are yellow in color and insoluble in water whereas the salts have a red color and a different crystal shape and are soluble in water. The quaternary salts of the N-oxides of phenazine and quinoxaline can easily be purified and have stable melting points. Their crystals are similar in color to those of the N,N-dioxide of phenazine, probably owing to a certain analogy in molecular structure (Diagram 2). The quaternary salts of the N-oxides of phenazine are caused to react with potassium ferrocyanide in alkaline solutions to form the phenazinones of red and violet color (Diagram 3). Thus, new syntheses have been provided for 12 quaternary salts of the N-oxides of phenazine and quinoxaline (Tables 1 and 2). There are 2 tables and 6 references, 2 of which are Soviet.

Arylphenazines (Ariifenaziny). 2-Phenylphenazine and Its Derivatives (2-Fenilfenazin i yego proizvodnyye)

PERIODICAL:

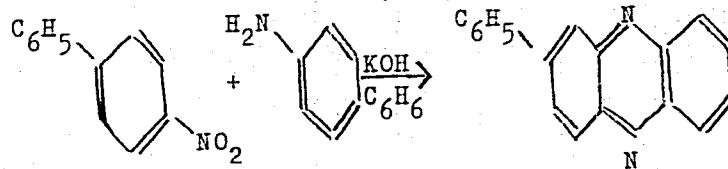

Zhurnal obshchey khimii, 1959, Vol 29, Nr 4, pp 1299 - 1306 (USSR)

ABSTRACT:

Aryl-substituted phenazines in α and β positions in the cycle were unknown until recently. In the article under review the syntheses and properties of 2-phenylphenazine, the 2-phenyl-6-methoxy-, 2-phenyl-8-methoxyphenazines, the N-oxides of these compounds, and the quaternary salts of the N-monoxides and quaternary salts of some bases of this series are described. The arylphenazines were synthesized by alkaline condensation of the corresponding nitrodiphenyls with aromatic primary amines in benzene solutions. Thus, e.g., 2-phenylphenazine was obtained from p-nitrodiphenyl and aniline according to the scheme

Card 1/3

Arylphenazines. 2-Phenylphenazine and Its Derivatives SOV/79-29-4-56/77

2-phenyl-6-methoxyphenazine was, accordingly, synthesized from p-nitrodiphenyl and p-anisidine, and 2-phenyl-8-methoxyphenazine from p-nitrodephenyl and o-anisidine. The bases with diluted sulphuric acid result in monoxyde salts of red coloring, with concentrated sulphuric acid in dioxide salts of green coloring which can be easily hydrolyzed. The bases are oxidized with hydrogen peroxide, according to temperature, in glacial acetic acid. They form the corresponding N-monoxides or N,N-dioxides of deep orange coloring. The N-monoxides of arylphenazines may also be obtained by alkaline condensation with an excess of the nitro compound (Ref 1). So, e.g., the 9-oxide of 2-phenylphenazine may be obtained from p-aminodiphenyl and an excess of nitrobenzene (Scheme 2). Arylphenazines are easily crystallized from benzene or alcohol. All the bases mentioned

Card 2/3

Arylphenazines. 2-Phenylphenazine and Its Derivatives SOV/79-29-4-56/77

and their oxides were purified chromatographically on aluminum oxide, and their chromatograms were developed with benzenes. They were characterized by their constants and ultraviolet absorption spectra. Phenazinone was obtained from the quaternary salt of 2-phenylphenazine, and its structure was determined. There are 3 figures and 4 references, 2 of which are Soviet.

TITLE:

On the Guiding Effect of the Substituents in the Formation of
N-Phenazine Oxides (Osnapravlyayushchem deystvii zamestiteley
pri obrazovanii N-okisey fenazina)

PERIODICAL:

Zhurnal obshchey khimii, 1959, Vol 29, Nr 4, pp 1306 - 1311
(USSR)

ABSTRACT:

In the reaction of oxidizing agents with mono-substituted phenazine derivatives two formations of isomeric monoxides are possible (Scheme 1). In this oxidation process the oxygen atom acts as electron acceptor so that the attack of the oxidizing agent has to be directed against that nitrogen atom of the asymmetrically substituted molecule which possesses the higher electron density. In the course of the investigations discussed in the article under review the authors studied the guiding effect of the following substituents: the 2-methoxy group, the chlorine atom in position 2, and the chlorine atom in position 1. The correlation of the resulting monoxide was determined according to the ultraviolet absorption spectra. The following method was used: In advance two monoxides to be expected were prepared separately for each case under investigation. This was done by alkaline

Card 1/3

On the Guiding Effect of the Substituents in the
Formation of N-Phenazine Oxides

SOV/79-29-4-57/77

condensation of the corresponding aromatic amines with nitro compounds. The oxygen atom is known to appear in such condensations at the expense of the nitro group (Ref 1). For this reason the two isomeric oxides, e.g. those of 2-chlorophenazine, were obtained as a result of the condensations according to scheme 2. The absorption curves of the two isomers of the N-oxides were photographed by means of the spectrophotometer SF-4 in benzene- and alcohol solutions. Subsequently, the mixture of the same monoxides was prepared by oxidation of the corresponding weighed phenazine derivative in glacial acetic acid with H_2O_2 . The reaction product was chromatographed until the mixture of the two N-oxides was completely separated from the incompletely reacted base and the N,N-dioxide. The weighed mixture of isomeric monoxides was dissolved in benzene or alcohol and the absorption curve of the mixture was determined. It is not difficult to calculate the percentages of the individual components of the mixture by means of the absorption curve of the binary mixture and that of the two individual components. The afore-mentioned curves are explained in detail in the figures. There are 5 figures

TITLE:

Aryl Phenazines. 1-Phenyl Phenazine and Its Derivatives
(Arilfenaziny. 1-Fenilfenazin i ego proizvodnyye)

PERIODICAL:

Zhurnal obshchey khimii, 1959, Vol 29, Nr 6, pp 2046-2052 (USSR)

ABSTRACT:

Looking for new antitubercular preparations, the 1-phenyl phenazine, its chlorine- and methoxy substituted compounds, N-monoxides, quaternary salts of bases and quaternary salts of N-monoxides were examined and described in the present paper. The bases and N-monoxides of 1-phenyl phenazine were obtained, according to A. Wohl (Ref 2), by alkaline condensation of o-nitro-phenyl with corresponding amines (aniline, anisidine, chloraniline) or else of o-aminodiphenyl with nitro-derivatives of the aromatic series (nitro-benzene, nitro-chlorobenzene, nitro-anisole). In this way 1-phenyl phenazine resulted from o-nitro-diphenyl and aniline, or from o-aminodiphenyl and nitro-benzene, according to Scheme 1. Condensation of o-nitro-diphenyl with n-anisidine led to 1-phenyl-7-methoxy phenazine. During the condensation of the o-nitro-diphenyl with o-anisidine, the elimination of the methoxy group takes place, with simultaneous formation of a considerable quantity of

Card 1/3

SOV/79-29-6-59/72

Aryl Phenazines. 1-Phenyl Phenazine and Its Derivatives SOV/79-29-6-59/72

1-phenyl phenazine instead of the expected 1-phenyl-5-methoxy phenazine. If in condensation an excess of the nitro-component is taken, then in addition to the phenazine base monoxide is formed. The author attempted, according to reference 4 to obtain in this way the 9-oxide of 1-phenyl phenazine from o-nitro-diphenyl and aniline, but the yield was very small. During the reaction of o-aminodiphenyl with nitro-benzene the 10-oxide of 1-phenyl phenazine was obtained with a good yield because there are no obstacles of space. The quaternary salts of N-oxides of the 1-phenyl phenazine were obtained in the same way as earlier (Ref 6), under the influence of the dimethyl sulfate upon the N-monoxides in nitro-benzene, whereas the salts of bases were obtained by a cautious reduction of quaternary salts of the N-monoxides in water. During the reaction of dimethyl sulfate with 1-phenyl phenazine in nitro-benzene, quaternary salts are quantitatively obtained after a short time, at 125-130°, in linking the alkyl to the atom of nitrogen 10. The absorption curves of the obtained compounds are shown in 3 diagrams. There are 3 figures and 6 references, 5 of which are Soviet.

TITLE: Directed Synthesis of Isomeric Quaternary Salts in the Phenazine Series

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol. 30, No. 5, pp. 1661-1669

TEXT: In the reaction of monosubstituted phenazines with dimethyl sulfate two isomeric quaternary salts can form according to which of the two nitrogen atoms of the phenazine is bound to a methyl group. The scheme of the reaction is given. In the present report the synthesis of quaternary salts of the phenazine series with a clear structure is described. The basis of this synthesis is the capability of the N-monoxide of the phenazine and of the quinoxaline to form quaternary salts with dimethyl sulfate. In the production of the N-oxides of phenazines by Wohl's synthesis from aromatic nitro and amino compounds the state of the oxygen of the oxide can be predetermined by the suitable choice of the initial material (Ref. 2). In the reaction of this N-oxide with dimethyl sulfate the methyl group joins the other nitrogen atom, which is still free. The quaternary

salt of the N-oxide of the substituted phenazine which forms is reduced with zinc dust, whereby the quaternary salt of the phenazine derivative concerned forms, the structure of which is clearly fixed. The scheme of this synthesis is given in the example of the production of both isomeric quaternary salts of 2-phenyl phenazine. Twelve phenazinium perchlorates produced in this way are listed in Table 1. The decomposition temperature, yield, ultra violet absorption maxima, gross formula, and percentage content of N and Cl are given for each salt. Table 2 shows the results of 16 condensation reactions of aromatic nitro compounds with aromatic amines under the action of pulverized potassium hydroxide in boiling benzene. The initial products and the N-oxide of the phenazine series which forms are given for each reaction. Each N-oxide is characterized by yield, melting point or decomposition point, ultra violet absorption maxima, gross formula, and nitrogen content. Table 3 contains a list of 22 quaternary perchlorates of N-oxides of variously substituted phenazines and quinoxalines. The melting point or decomposition point, yield, form and color of the crystals, ultra violet absorption maxima, gross formula, and content of N and Cl are given for each salt. The N-monoxides of the phenazine series differ from the corresponding phenazines in that their

solutions in benzene or chloroform strongly fluoresce under the action of ultra violet rays. Also, the N-oxides have a decomposition point besides a melting point, the former of which is either higher than the melting point or equal to it. Characteristic differences occur also in the absorption spectra, which are given. A Fig. shows the absorption spectra of alcohol solutions of phenazine, phenazine-9-oxide and 1-phenyl-phenazine-10-oxide. All of the conversions carried out are thoroughly described in an experimental part. The author thanks A. I. Kiprianov for his interest in the present paper. There are 5 figures, 3 tables, and 3 Soviet references.

TITLE: Cyanine dyes, derivatives of imidazophenazines and their absorption spectra

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 32, no. 11, 1966,
1200-1205TOPIC TAGS: condensation reaction, heterocyclic base compound, cyanine dye, polymethine dye, absorption spectrum ~~shift~~, photosensitivity,
DYE CHEMICAL, ORGANIC SALT

ABSTRACT: Nine cyanine and carbocyanine (polymethine) dyes, symmetric and unsymmetric, have been synthesized by condensing quarternary salts of 1,2-dimethylimidazo (4,5-b)phenazine with an orthoformic ester or derivatives of quinaldine, benzothiazole, benzoxazole, or rhodanine. The maximum absorption peaks of the synthesized dyes were determined in alcoholic and acidified alcoholic solutions to explore the effect of the phenazine ring substituent in imidazole on the sensitizing property of the dyes. A strong bathochromic shift was observed with all nine dyes in the acidified solution as compared to the neutral solution.

Card 1/2

UDC: 547.866

ACC NR: AP7000261

This shift resulted from protonization of one N atom, probably in the 5 position of the phenazine nucleus, which promoted simultaneous formation of a new, long chromophore chain. The highest absorption peak — 698 m μ — was found in a neutral solution of a thiadicarbocyanine, a derivative of 2-methylbenzothiazole. Orig. art. has: 1 table and 6 formulas.

ABSTRACT: This article discusses the effect of temperature on the scattering of X-rays on laminated crystals. It uses the law of dispersion of heat (acoustic) waves, which I.M. Lifshits previously introduced in a computation of heat capacity (Zh. eksperim. i teor. fiz., 1952, 22, Nr 4, 471). Formulae are given for the heat factor and approximations for low temperatures are considered. The differences from the corresponding expressions for ordinary crystals are considered as applied to reflections from the planes which are parallel and perpendicular to the layers.

ABSTRACT:	An Author Certificate has been issued for a preparative method for corrosion inhibitors for metals which involves petroleum product nitration. To increase the inhibitor effectiveness, to lower its cost, and to widen the range of available inhibitors, petrolatum, or oxidized petrolatum, or pyro polymers, or a mixture thereof are nitrated. TITLE: Experimental use of biological caps in arthroplasty of large joints

CITED SOURCE: Tr. 3-y Nauchn. konferentsii molodykh uchenykh Moldavii. Biol. i s.-kh. n. Vyp. 2. Kishinev, 1964, 252-253

TOPIC TAGS: dog, arthroplasty, knee, joint, heteroperitoneal cap, connective tissue, ankylosis

TRANSLATION: In an experiment on dogs the menisci and cartilage were removed from the joint surface of the femoral bone (knee joint), with subsequent placement of heteroperitoneal caps. In another experiment the menisci and cartilages were removed from both joint surfaces and followed by placement of caps. In the third experiment the restoration of extremity function was studied after experimentally induced fibrous ankylosis. In the fourth experiment cartilage was

Card 1/2

ACCESSION NR: AR5002519

removed from the head of the femoral bone with subsequent placement of a heteroperitoneal cap. In the fifth experiment the antigenic properties of a heteroperitoneal cap preserved in formaline and alcohol were studied. Movement of joints in the dogs was completely restored by the end of the 3d-4th mos. The heteroperitoneal caps prevented the growth of connective tissue into the joint and the formation of fibrous-cartilaginous ankylosis in the joint. N. S.

TITLE: Application of dynamic programming to preventive maintenance of
multielement complex systems

SOURCE: Archiwum automatyki i telemechaniki, v. 11, no. 2, 1966, 165-176

TOPIC TAGS: dynamic programming automatic control technology, optimal
control, multielement system, preventive maintenance, maintenance cost

ABSTRACT: Modern technical devices require routine maintenance. Considering
the generality of this aspect, the control of equipment, the problem of
minimizing general control costs becomes very important. This minimum can
be obtained by optimization of checkout programs. There is a large class of
complex plants for which the existing methods of optimization of the state control
process do not yield the best results. The authors propose a new method of
finding the optimum control program based on dynamic programming. Considering
the probability of failure of a component and control costs, a new formula

Card 1/2

L 00851-67

ACC NR: AP6029483

is obtained which permits determination of average control cost. The criterion of the optimum checkout program is also formulated. An extension of the Bellman principle of optimality is developed with reference to control of the condition of complex systems. Analytical relations, describing the optimization process, are given in a general form. The flow chart of graphical and analytical solutions of this problem is shown in the original article, which makes an analysis of the optimization process much easier. Theoretical considerations are illustrated by a simple computational example. Control programs are obtained for the same plant by the method of dynamic programming and the method of steepest descent. Limitations of the method of steepest descent and advantages of the new method are shown. Orig. art. has: 2 figures, 17 formulas and 3 tables. [Based on authors' abstract] [NT]

Twenty patients were treated with N₁-carboethoxy-N₂-hydrazinophthalazine-hydrochloride in a dose of 60 mg. per day. In 16 patients with arterial hypertension a decrease of arterial blood pressure, both systolic and diastolic, was obtained. In

every case there was an improvement of the patient's general subjective condition and better sleep. Headaches disappeared and the heart's action — if it has been previously accelerated — slowed down. Functional renal tests showed that the renal flow increased under the influence of the treatment. The phthalazine product has no harmful influence on the glomerular filtration nor on the urine concentration and dilution of the kidney. It was possible to detect with Fehling's reagent the remains of the drug in urine 3-4 days after cessation of treatment. No toxic symptoms were observed.

Effect of ultrasonic waves on electroluminescence of the
ZnS-Cu phosphor. H. Łozikowski and M. Rozwadowski
(Univ. Toruń, Poland). *Bull. acad. polon. sci., Ser. sci.
math., astron. et phys.* 7, 651-2(1959)(in English).—The
effect of ultrasonic waves (680 kc.) on the brightness of
electroluminescence of ZnS-Cu phosphor of activator
concn. 4.6×10^{-3} g./g. suspended in castor oil and excited
by a field of 0.2-5 kc. was studied. Oscillograms are given.
Changes observed were not related to temp. variations.

"Results of Blood Cultures on Bile-Broth Medium Made at the Bedside of Typhoid Fever Patients"

Warsaw, Przeglad Epidemiologiczny, Vol 20, No 3, 1966, pp 311-313.

Abstract: Blood cultures from typhoid patients and suspected cases were run over 2 years at the patients' bedside in parallel tests with bile-broth and inoculation of blood clots after centrifuging. Direct bedside cultures confirmed the diagnosis of typhoid fever in up to 71% of cases using the bile-broth medium and in about 23% using the clot cultures.
